Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Brainstorming & Ideation Phase

Objective

To identify a practical IT procurement problem and propose an automation-based solution using ServiceNow Flow Designer.

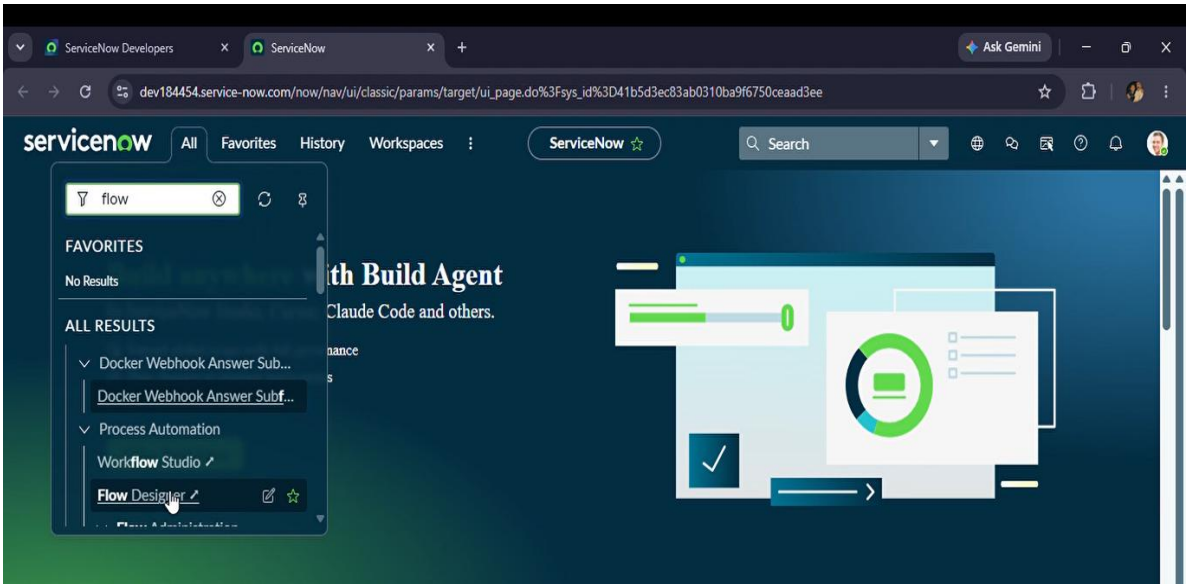

Activities Performed

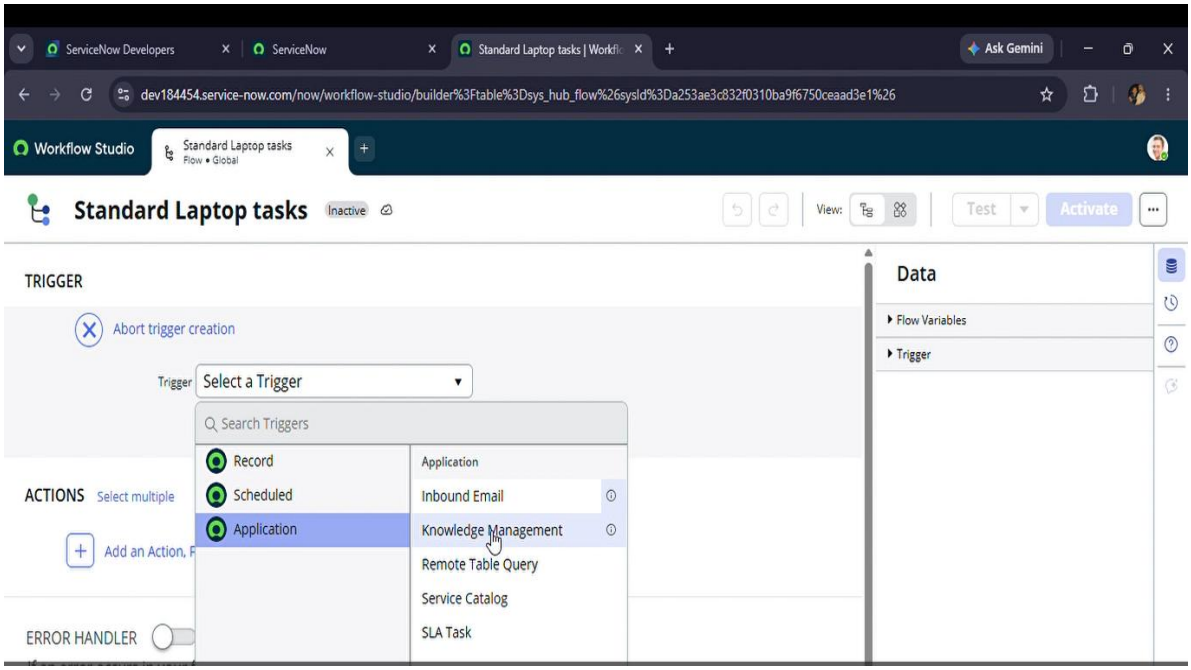

- The project idea was developed around the manual process of requesting and procuring standard laptops for employees.
- Common issues considered were repeated manual activities, approval delays, inconsistent request handling, and lack of process visibility.
- The team identified Flow Designer as a suitable automation tool for creating a structured request-to-fulfilment workflow.
- The proposed solution focuses on standard laptop orders so that frequently used procurement steps can be automated.

Expected / Produced Output

The project concept: when a standard laptop request is submitted, the system initiates the required approval and fulfilment activities through an automated flow.
