2. Requirement Analysis Phase

Objective

To understand the functional requirements, users, inputs, approvals, automation steps, and expected outcomes of the laptop procurement process.

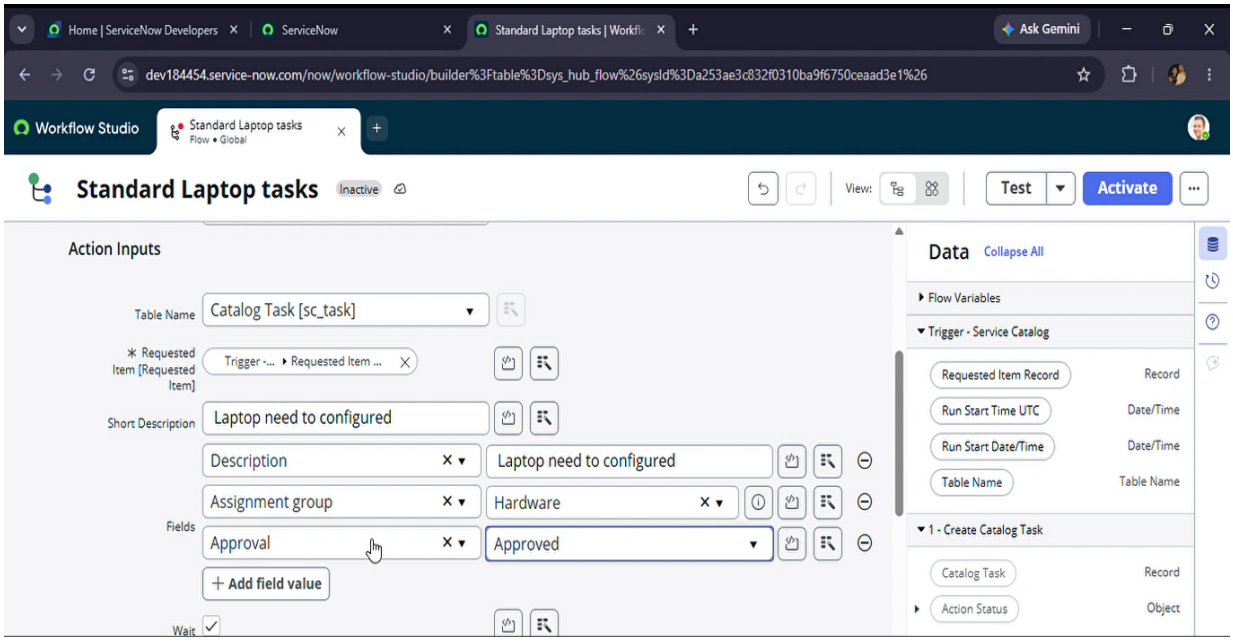

Activities Performed

- Identify the requester and the person or group responsible for approving the laptop request.
- Define the information required from the requester, such as laptop requirement and relevant request details.
- Define the condition that identifies a request as a standard laptop order.
- Determine the approval step required before procurement or fulfilment.
- Define the actions that should occur after approval and the actions required when a request is rejected.
- Identify the need for status updates and process visibility.

Expected / Produced Output

The requirement analysis results in a clear automated workflow: Request Submission → Validation/Condition → Approval → Fulfilment/Notification → Completion.
